

WIRELESS PERIPHERAL AND RELATED SYSTEM CAPABLE OF INDICATING WIRELESS CONNECTION STATUS WITH ALARM

Abstract

A wireless system has a host and a wireless peripheral, such as a cell phone and a corresponding wireless handset. When the system is in use, if a wireless connection between the host and the peripheral is disconnected, the wireless peripheral is capable of alerting a user by sound, light or vibration alarm. In addition, the host is capable of generating sound, light or vibration to indicate its location when it is disconnected.
